Malware Scanner V1.8 - Malicious Code Detector

Malware Scanner will help you to scan your website with just one simple click. It can find both known and unknown viruses, shells, malware, malicious code infections and other website threats.

Malware Scanner comes with powerful admin panel from which you can a run scan and it is also integrated with Security Check tool. The Admin Panel has many features and settings. Scan Process can be customized.

Main Features

Malicious Files Scanner

Antivirus Scanner that will scan your website for malicious files and will notify you if any are detected.

Normal Scan option

The normal scan scans all files with the simple scan engine.

Deep Scan option

The deep scan scans all files with the heaviest scan engine, but could show many false-positive threats.

Scan Customization

You can choose which directories and files with specific extensions to be scanned. Files and directories can be whitelisted.

Customizable Scan Strings

Additional scan strings can be added.

Detailed Information

The script offers detailed information about the detected file like File Stats and Threat Information.

Security Check

Powerful tool that will list all vulnerable PHP Functions that are enabled on your host.

Dashboard with File Stats

On the Dashboard you can check the Statistics.

No database required

The script works without database connection.

Very Optimized

The script is very lightweight and won't overload your website.

Fully Responsive

Looks good on many devices and screen resolutions.

Easy to setup

The script is integrated with Installation Wizard that will help you to install the app.

Easy for use

The script works on the "Upload & Run" principle.

and many more...

Requirements

PHP

Installation Instructions

Upload the files from the "Source" folder on host via FTP

Visit your website where you uploaded the files (eg: yourwebsite.com/scanner/)
