Description

Safari is the official browser of macOS, with ports being available on iOS and Windows. This windows version that we will describe today represents one of the best browsers you can find today on market, with support for all customization options you would require and tight integration into complete cloud-powered services from Apple. Built using WebKit rendering engine, the software enables users to explore everything that the internet has to offer, from static pages to highly interactive professional presentations, multimedia, social networking, direct communication, and more. Using more than a decade of experience in crafting great user experience, Safari browser manages to create the perfect balance between usability, support for all modern internet standards, and a phenomenal interface that can be easily used by everyone, including complete internet novices.

But, speed and elegance is not everything that the PC browser offers. The core of its software package is rock-solid security that monitors your online sessions and prevents malware or phishing attempts to compromise your online experience, local storage, or your personal information.

Between its inception in the summer of 2003 and early 2014, Safari for PC offline installer went through seven major versions that followed the expansion of the internet services and adopted all the modern internet protocols for easy access of multimedia-rich content. Its latest seventh version has brought many upgrades, including faster JavaScript rendering, better memory usages, new Shared Links feature, Power Saver that turns of plugins when they are not in use, and several changes in visual design.

See what's new in Safari:

Unified Smart Search Field. Get everywhere from here.

Now there's one simple field for both search terms and web addresses. When you enter a web address, the tool takes you right to the web page — and even fills in the entire URL. It finds what you're looking for in a faster and smarter way.

Tab View. A new point of view.

Tab View gives you the big picture of your browsing. Just pinch to see all your open tabs. Swipe left or right to move between them. And tap a tab to go right to the website. Multi-Touch makes Tab View a fun and natural way to browse.

iCloud Tabs. Pick up the web wherever you left off.

iCloud Tabs makes the last websites you had open on your Mac available in the tool on your iPad, iPhone, and iPod touch. So you can go from one device to another without having to search for the web pages you were reading. It happens without syncing.

Built-in sharing. Everyone's in on it.

Now you can share anything you come across on the web right when you come across it — without leaving the program. Just click the Share

button, then choose how you want to send it off. Share web pages using Mail or Messages. Post them on Facebook. Tweet links. And even add comments and locations.

Improved performance. It's power-browsing.

With improved performance in the tool, web pages load faster. The Nitro JavaScript engine takes advantage of the multiple processor cores on your Mac, so you'll notice fewer lags and pauses while you browse. It also uses a new approach to CSS that speeds up rendering.

Better Privacy.

It takes your privacy seriously. You can turn on Do Not Track, an emerging privacy standard. Checking this Privacy pane preference sends websites you visit a request not to track you online. The app also sends a request to websites not to track you when you use Private Browsing.
