### Description

#### Videobox Joomla Extension Free Download

Videobox V6.0.0 is a Joomla! 3.6+ extension for adding video (and audio) to your site. It supports videos from YouTube and Vimeo, as well as music from SoundCloud, Twitch streams, and HTML5 supported video and audio formats. It offers several ways to insert a video, including direct player, pop-up player, and a video gallery. Just put the video link in the Videobox tag and you'll be up & running!

Box display is a great way to insert videos without sacrificing a lot of space for the player. That way it makes your articles straight to the point without unnecessary distractions while keeping the videos right where they belong to. Rather than the huge full-size video player taking up space and distracting the reader, the box display only shows a small video thumbnail with an optional title. When user clicks the thumbnail, the video opens in a lightbox player, or in an inline player. The box element itself behaves just like the photos in your article - you can set it to float to the left or to the right, centre it with margin: 0 auto; or apply any other CSS styling to it.

Box display is great, however it's not ideal when the video is just an irrelevant reference or a note, or when the video itself isn't directly related to the topic. In this case even a small box thumbnail would be irrelevant and distracting for the reader. An ordinary link to the video seems good enough, but when users click it they leave your website. Videobox link display solves that problem - you can still keep the reference, but instead of redirecting users to an external page the link will open a lightbox player directly on your website.

In a way, the gallery display is the exact opposite of the box and the link display. It's designed to display a lot of videos in an organised manner, featuring a responsive grid and a built-in pagination. That way you can insert all of your videos at once and let users browse through them quickly. Alternatively a gallery can be displayed as a slider, showing only a few thumbnails at a time.

What are you waiting for? Give it a try!

#### Features:

- Specify playback end time for YouTube and HTML5 videos
- SoundCloud integration (since 4.0.0)
- Modular video source adapters (since 4.0.0)
- Start playing video when page is opened (since 3.0.0)
- Works with any Joomla! component, not just with articles (since 3.0.0)
- Play button on thumbnails (since 2.0.1)

Full video URL as video ID (since 1.1.1)  
HTML5 video and audio support (since 2.0.0)  
Non-lightbox player for box display and gallery (since 1.1.0)  
Native Joomla! pagination for galleries  
Custom class and style (since 2.0.0)  
Player offset for each video (since 1.1.1)  
Almost all settings can be overridden and set for each plugin call separately
